Monthly bulletin – N° 187 – December 2005

## Focus

### Eurozone: core inflation has never caught up with the inflation headline

Source: Eurostat; (e): Morgan Stanley Estimates

# ECB: Good Move, but Mind the Economy

The ECB decision to raise the bank's main lending rate by a quarter of a percentage point was the right one at the right time. It marks the end of the "zero real interest rate" policy initiated after euro-area growth came to a standstill, back in 2003. The medicine was not as radical as the one used by the Fed in the U.S. but, in the end, it delivered: Credit to the private sector took off and is now growing at a 9% clip.

## A robust domestic demand recovery

With all due respect for Nobel Prize winners Joseph Stiglitz, Robert Mundell and Gary Becker, who criticized the ECB's decision without paying enough attention to the real data, waiting for more evidence of the recovery would have been a mistake. Q3 data have demonstrated that growth was driven by final domestic demand: the euro-area GDP increased at an annualized rate of 2.5% with final domestic demand up 2.4%. In this respect, it is not different from the past – Euroland GDP growth is 90% driven by domestic demand since 1999-- except in one aspect. This time, Germany is part of the game, and that makes a big difference.

## Let it grow faster than trend

Hence, keeping rates at the emergency level where they were stuck since June 2003 would have sent a message of no-confidence to companies, consumers and the financial markets. It would have also channeled more savings into highly speculative investment vehicles and encourage carry trades even further. Having done the right thing, the next challenge for the ECB is to remain pragmatic enough to let the economy catch up progressively with its potential, that is to grow faster than trend.

## Core inflation has been permanently lower than headline

This is where the ECB's messages make us slightly uncomfortable. Dismissing the concept of core inflation under the pretext that headline leads core rather than the other way around is unconvincing. The fact is, since January 1999 core inflation, which is precisely where one would fear to see second round effects jeopardizing long term price stability, has been four-tenths lower than headline. This shows that the unemployment rate has been almost permanently below any reasonable measure of a non accelerating inflation rate of unemployment, or NAIRU.

## The recent rise in energy prices is a supply side shock

The alleged symmetry between rising energy prices and declining manufacturing prices is also unconvincing. It is argued that China is providing ever cheaper goods because of its colossal unemployed workforce while at the same time boosting energy prices. Elegant as it might sound, this idea does not fit with the facts. This year, Chinese net imports of crude oil and refined products have barely increased (+3% on the year until October), while the price of Brent has increased by 43%. The big jump in energy prices was caused not by demand but by the accidental shutdown of US refineries when the industry was operating almost at full capacity. This was a genuine supply side shock, having nothing to do with globalisation.

## Keep it below 3%

In conclusion, it is good news that the ECB is not pre-committing to any pace of normalization, nor on any normative neutral rate target. Going forward, the ECB should raise the refi rate in sync with the recovery while keeping monetary policy expansionary, until output gets closer to potential. Unless GDP growth accelerates significantly above 2.5% next year, this would be consistent with a refi rate not exceeding 3% significantly in 2006.
