## What moves the European bond market:

Bond investors typically base investment decisions on priors they have about the future state of an economy. To formulate these views, investors use the latest data available to form a view of how the upcoming economic data should look to validate their baseline scenario. As new information becomes available, investors readjust their priors accordingly depending on whether the data confirm that scenario or not.

It is the “forecast error” (the difference between average expectations and the actual outcome) in the release of economic indicators that moves markets. Because some indicators provide more information about the state of the economy than others, surprises in these indicators have a greater impact on the market than surprises in indicators with lower information contents.

We have constructed the RBS Market Impact Database (RBS MID) which includes consensus expectations of economic data and actual outcomes of first releases for a selection of 28 indicators covering the US, UK and euro area from 1999. The database includes intra-day bond price movements around the time of each release. To our knowledge, this constitutes the most comprehensive databank of historical data on economic data surprises and market responses (around 100,000 observations in total).

We have focused our attention on the reaction of the ten year German bund future in the first instance. Of 28 indicators considered in this report, surprises in about fifteen have a significant average impact on the price of the bund following the first ten minutes of the release, (see table 1). Of this fifteen, ten have a very significant impact.

The euro area bond market is predominantly driven by foreign indicators: of the 15 largest European market movers, 9 are US indicators and only 6 are euro area indicators. Of the top 10, only 3 are from the euro area (table 1). The US non farm payrolls and advance GDP reports top the bond market mover rankings. The largest euro area market mover is the IFO, a touch above the ZEW survey, occupying the 5th and 6th ranks respectively. German GDP comes in at number seven. Euro area aggregates such as euro area retail sales, industrial production and confidence indicators have the smallest market impact.

That US data dominate the European bond market is not a surprise. The US economy has been the engine of growth of the global economy and thus provides some leading indications on the state of the euro area economy. However, the size of the market response seems somewhat exaggerated in our view: for example a forecast error in US GDP will lead to a European market reaction on average over twice as large as a similar surprise in German GDP. A forecast error in the US ISM has an impact 4.5 times greater than a similar surprise in the euro area PMI.

More surprisingly, US indicators have a larger impact than European ones even when they are published later. This is the case with the US ISM, which is published after the euro area PMI or the IFO, or the US CPI report, which is published after the German or Euro area report. While we believe that the US economy leads the euro area, the European market response to some US indicators also seems somewhat disproportionate. In particular, a surprise in US core inflation has more than twice the impact on the European market as a similar surprise in German CPI, which is normally released about 3 weeks earlier.
