Focus

Excess liquidity has depressed levels of implied volatility

At the end of 2006, implied volatility in all markets reached extraordinarily low levels. In the foreign exchange markets, 1-month implied volatility for the euro-dollar and dollar-yen fell to respectively 5.50% and 6%. For the euro against sterling and against the Swiss franc, this volatility was only 3.4% and 2.4% in November and December. In the equity markets, the VIX declined temporarily below 10% and the VDAX below 12%. Finally, in the fixed income markets, volatility for the 5Y-5Y euro swaption currently stands at around 13% (see Focus).

If volatility measures uncertainty, then the levels reached of late are surprising for there are major uncertainties on nearly all fronts at the moment:

1. Monetary policies: rarely has there been such important dispersion regarding expectations as to the future conduct of monetary policies. All options are possible for the Federal Reserve: while some analysts believe that the real estate crisis (the main reason for the US economic slowdown) is nearly over, others fear this crisis will spread and affect other components of domestic demand (through the wealth effect) and result in a hard landing. Likewise for the European Central Bank, convinced even now that inflation is a monetary phenomenon, despite the facts having said obstinately the contrary for several years. At the same time, it is playing the watch to see how the tax measures implemented in Germany will affect growth and inflation. There were no monetary surprises in 2006, but this seems to be changing, as shown by the Bank of England, which caught everyone out by raising its base rate on Thursday 11. Nor did many expect such a dovish press conference by JC Trichet that same day. In the US, the next Beige Books and press releases in the wake of the forthcoming Federal Open Market Committee Meetings could also surprise.
2. Crude oil prices: the decline in the price of Brent crude will have surprised more than one. This has been due largely to the exceptionally mild winter nearly everywhere in the northern hemisphere. If temperatures do not converge nearer normal levels for this time of year by spring, one can expect crude oil prices to continue declining in the second quarter. If a decline there is, it will hardly be slowed even by probable cuts in production quotas. This would be good for growth, but would undermine current scenarios of a soft landing in the US and in the Eurozone.
3. Geopolitical environment: the situation in the Middle East remains extremely tense. In the short term, the situation is more likely to deteriorate than improve. This third factor obviously has a bearing on the second.

One could also mention that credit spreads are exceptionally tight suggesting that, if there is a normalisation of the situation (i.e. a rise in interest rates and a widening of spreads), one could see a cascade of bankruptcies amongst the frailest companies. Finally, certain emerging countries, notably Turkey and Hungary, are still in a tricky situation and it is possible they could lose the trust of investors at any moment.

In brief, sources of uncertainties are legion and yet implied volatilities are at their lowest. Why this paradox? Mainly it is because of the excess liquidity at global level, which also has for consequence to maintain interest rates at very low levels generally, to depress credit spreads, and to pump up many asset prices. Liquidities will remain plentiful in 2007, meaning that the financial landscape described above will not change much.
