NEWS

France consolidates its position as an issuer of very long securities

After a rapid completion of the order book, which opened at the start of trading day and closed in the early afternoon, Agence France Trésor issued €5bn of the new 50-year benchmark bond: i.e. the OAT 4% 25 April 2060. The total demand, amounting to €8.3bn, enabled the indicative price range for the issue to be tightened to the lower bound of the initial range of 2 to 4 bps. As most of the orders were placed without any price sensitivity indication relative to the initial price guidance, the pricing was made at 2 basis points (bps) above OAT 4% 25 April 2055, i.e. a yield of 4.175%.

France has now firmly established herself as currently the euro zone's sole issuer in the very long securities segment, thus providing the State with long-term financing at optimal rates. Investors showed that they were keen to take a very long position with a quality issuer such as France. The allocation reflects substantial demand from long-term final investors, with asset managers receiving 37% of the total amount allocated, pension funds 30% and insurance companies 9%.

The geographical distribution also indicates a steady demand, mainly from Europe, with the United Kingdom and the Netherlands taking 21% and 28% of the total amount allocated, Northern Europe 16% and France 10%. The allocation also highlights active participation by US investors, who account for 18% of the total.

The lead managers for this operation were Barclays, BNP Paribas, Deutsche Bank, JP Morgan and Société Générale. All the primary dealers were part of the syndicate.

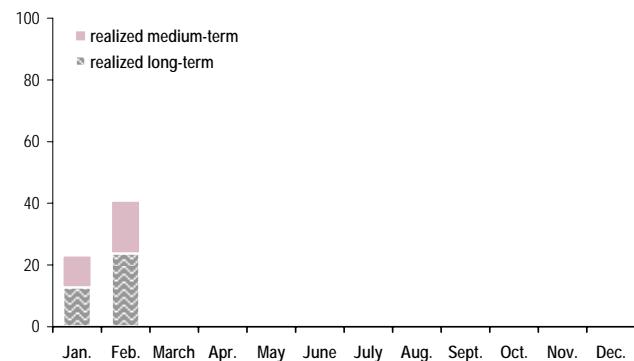

The launch of this new 50-year benchmark bond reflects the AFT's strong commitment to maintaining liquidity throughout its yield curve. In order to meet market demand, the OAT 4% 25 April 2060 will subsequently be

The euro depreciation: Good news - but maybe not for all

By Laurence Boone, Chief French Economist, Barclays

Financial difficulties of Greece went hand in hand with an important depreciation of the euro: the euro/dollar went from 1.51 on November 25th, 2009 down to 1.35 on February 23rd of this year, becoming stable around 1.36 since, that is a 10% correction. This decrease was warmly welcomed by Europeans, but by breaking down the effects of the euro on trades and finances of the euro area, the effects of depreciation could be slightly overrated.

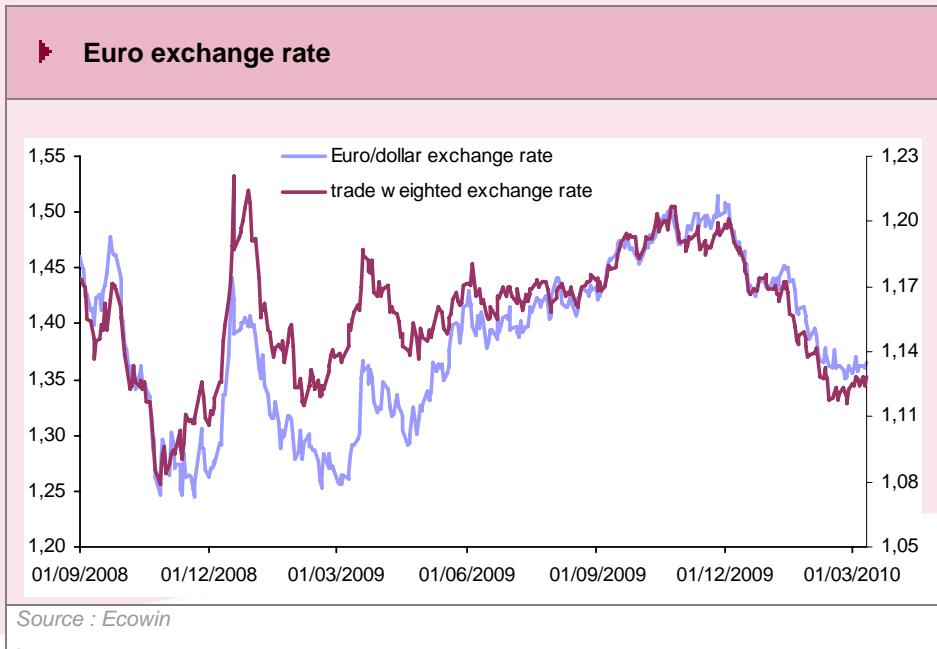

The recent exit from crisis showed that the movements of exchange rate could be prejudicial for the euro area. While the Asiatic motors supported global demand fast at the beginning of 2009, they did not much benefited the euro area, perhaps partly because over the same period the euro was appreciating vis-à-vis the dollar (the euro appreciated by about 20 % between autumn 2008 and the end of 2009, passing from 1.24 to 1.51). If it is true, in the opposite, the depreciation of the dollar in relation to the euro should therefore be advantageous for exchanges of the euro area. Exchanges of the euro area with the rest of the world (except European Union) represent about 20 % of the euro area's GDP: in weighted trade volume terms, the depreciation of the euro was therefore only 5%. This is positive but somewhat more modest. Looking across countries, Germany is the euro area country which would benefit most from the euro's depreciation, with a share of exchanges in GDP towards the United States and emerging Asia of about 10%.

The effects of the variations in the exchange rate also have an impact on the value of dollar-denominated portfolios of households, central banks or firms. According to P. Lane and G.M. Milesi-Ferretti (2007), the effects of an appreciation of the dollar would be rather negative in total by this channel, but modest, notably because contrary to China and to Japan, the euro area is net borrower in dollar. That being said, all countries of the euro area are not equal in front of these portfolio effects: particularly, the countries of the euro area's periphery have a sizeable external deficit and partly financed in dollar. For these countries, especially those with a modest share of trade to the United States and emerging Asia in % of GDP, a depreciation of the euro is overall not such a good news directly, but mainly through the benefits of Germany's growth becoming stronger.

Besides, the depreciation of the euro should not eclipse that the main problem of the zone is the existence of internal imbalances due to the last decade deterioration of competitiveness of some euro countries in comparison with Germany. Measuring the fall of competitiveness of some countries in relation to Germany in terms of labour costs, the adjustment to be achieved is at least as impressive as the recent fall of the euro: adjustment would be in the order of 7% for Greece, 10% for Portugal, 12% for Spain and 20% for Ireland.

The decline of the euro, if it continues or increases, is good news for the growth of exports from Germany. But it does not solve the issue of internal imbalances in the euro area that are mostly related to competitive wage differentials.

NB: this Agence France Trésor forum offers economists an opportunity to express their personal opinion. Thus, the above article strictly reflects the author's view, and should not be construed as expressing the viewpoints of Agence France Trésor or the Ministry of the Economy, Industry and Employment.
